PROFESSIONAL EXPERIENCE

Simeon Global Consulting

Aug 2026 – Present

Data Engineer & AI Consultant

Tallahassee, FL

- Engineered Azure Data Factory pipelines to ingest daily operational data from SharePoint-hosted Excel trackers, combining internal records with externally collected data from Python web-scraping workflows for downstream reporting and analysis.
- Developed an AI-enabled SITREP generation workflow using the Claude API, packaging operational data into structured prompts and returning generated report content through an ArcGIS-based application with PDF output.
- Built a bureau-wide training management application for FDEM Mitigation using Power Apps Canvas Apps and SharePoint Lists, with role-based access and centralized internal training records.
- Developed internal AI and web applications using Next.js, Supabase/PostgreSQL, and Vercel, including AI-assisted portfolio content generation and database-backed internal tools.

Data Engineer

Mar 2026 – Aug 2026 · Tallahassee, FL

- Built a Cox Proportional Hazards survival model (concordance index 0.923) combined with a custom LPC clearance-rate model to forecast closeout timing for FDEM's 60-grant Public Assistance portfolio, correcting prior forecasts by 6 to 15 years on major grants including Hurricane Irma and Hurricane Ian.
- Derived corrected payment closeout thresholds from historical grant data, replacing an inaccurate assumed value and increasing the number of active grants with a reliable closeout projection from 4 of 20 to 16 of 20.
- Built a risk classification framework across the active grant portfolio based on corrected closeout timing, surfacing high-risk cases for targeted follow-up.
- Built an automated payment reconciliation pipeline for FDEM's Mitigation Bureau in Python, matching mitigation payments across the internal tracker, CFO payment history, and DFS state payment records into a single reporting table feeding a Power BI dashboard, with full match coverage across all 1,700 payments received to date.
- Built a caching layer for slow external state payment lookups and match logic that routes uncertain matches to manual review instead of guessing, keeping reconciliation accurate as payment volume grows.
- Built a Power BI dashboard covering payment status, bottlenecks, vendor concentration, and data quality, giving bureau leadership a clear view into where payments stood and where delays were happening.

Florida Division of Emergency Management

May 2025 – Mar 2026

Data Analyst

Tallahassee, FL

- Architected a Python and Azure Blob Storage data lake to store and version FLAIR/FOCUS financial extracts, supporting historical reprocessing, audit trail maintenance, and cross-period reconciliation independent of source system availability.
- Engineered end-to-end data pipelines from FLAIR/FOCUS through Azure Blob Storage to Power BI, fully automated and built from scratch on greenfield infrastructure with no prior systems to build on.
- Deployed 15+ Power BI semantic models bureau-wide using DAX, calculated columns, row-level security, and Power Query transformations, enabling self-service reporting for 50+ stakeholders without analyst intervention.
- Built SQL-driven KPI frameworks connecting live financial data sources to Power BI, enabling leadership to monitor multi-billion-dollar program operations and track performance against objectives in real time.
- Built and maintained Python ETL pipelines ingesting 500K+ rows daily from authenticated .NET web portals, automating login flows and CSRF token handling via Selenium, scheduled via Windows Task Scheduler for zero-touch daily execution.
- Built a Contract Routing Tracker mapping every step of multi-million dollar approval workflows, flagging delays automatically and giving managers a live bottleneck view, reducing average contract approval time by 30%.

Aramark

Nov 2023 – May 2025

Data & Finance Analyst

Tallahassee, FL

- Built Python and SQL ETL pipelines to generate automated sales and revenue reports across \$35M+ in annual transactions; trend analysis surfaced key revenue drivers and contributed to a 20% improvement in forecasting accuracy.
- Owned month-end close activities including variance analysis, account reconciliation, and forecast updates, standardizing templates and automating repetitive data pulls to reduce close cycle friction.
- Handled weekly financial operations covering \$500K+ in AP/AR, invoice processing, and account reconciliations; automated invoice tracking using Power Automate and SQL, cutting processing delays by 30%.
- Built 10+ Power BI dashboards covering 25+ KPIs across \$35M+ in operations, including DAX measures, drill-through pages, and real-time data connections so leadership could analyze financials without waiting on manual reports.
- Replaced manual reconciliation workflows with Excel VBA macros, cutting weekly reconciliation time by 40% and eliminating formula errors that had caused prior reporting discrepancies.

- Generated and distributed daily sales variance reports giving operations managers a quantitative view of performance versus plan each morning.

Sravanthi Engineers

Jul 2021 – Jun 2023

Finance Analyst

India

- Allocated costs across active contracts and produced management reporting with a clear breakdown of spend versus budget on every project.
- Performed tender analysis and built detailed cost estimates for work orders, breaking down material, labor, and overhead to produce competitive bids and accurate project budgets.
- Filed GST returns and maintained compliance records on schedule, ensuring statutory deadlines were met without penalties.
- Prepared site measurement reports reconciling estimated versus actual material and labor usage, used to settle contractor disputes and calibrate future cost estimates.
- Managed end-to-end AP/AR and invoicing across multiple simultaneous engineering projects, tracking payment milestones, following up on overdue accounts, and maintaining cash flow visibility for project leadership.

ZAWN

Feb 2021 – Apr 2021

Software Engineering Intern

Ottawa, Canada (Remote)

- Diagnosed and resolved slow MongoDB queries in high-traffic collections by adding compound indexes, restructuring aggregation pipelines, and rewriting query logic, bringing API response times down by 40%.
- Wrote automated regression test scripts in Selenium and PyTest, reducing manual testing burden per release and improving release confidence.
- Built and integrated frontend components including profile avatar upload and dropdown navigation, contributing to a 15% lift in user engagement post-release.
- Traced recurring bugs in alert and complaint submission flows, wrote detailed issue reports with reproduction steps, and worked with the dev team to resolve root causes responsible for 30% of customer complaints.

PROJECTS

Retrieval-Augmented Generation (RAG) PDF Query System

[GitHub](#)

- Implemented FAISS-based embedding indexing and chunk overlap tuning to keep retrieval fast and accurate on locally run models with no cloud dependency.
- Built a local RAG pipeline using Ollama and vector embeddings where users query large PDFs and get context-grounded answers retrieved from the most relevant document chunks before generation.
- Built a Flask REST API wrapper around the RAG pipeline, exposing document query functionality as an HTTP endpoint for integration with frontends and external tools.

Tally Code Brewers Hackathon — Quiz Platform (Semifinalist)

[GitHub](#)

- Built a full-stack quiz platform in Flask and MongoDB under hackathon time pressure with dynamic question loading, real-time scoring, per-user unique links, and re-attempt blocking; placed semifinalist among 200+ teams.
- Designed a flexible MongoDB data model supporting variable point values, time-limited link activation, and per-user access control without hardcoding quiz-specific logic.
- Stress-tested concurrent quiz submissions and tuned backend query patterns to handle load without score drops or duplicate entries.

Shopping Recommendation and Sentiment Analysis Systems

[GitHub](#)

- Wrapped both models in a Flask REST API and built automated reporting generating spend analysis summaries and live sentiment scores on demand for business stakeholders.
- Trained a TF-IDF and Scikit-learn text classifier on restaurant review data, reaching 88% accuracy in sentiment labeling with output feeding a reporting layer for service quality trend analysis.
- Built a KNN-based product recommendation model on purchase history data, surfacing complementary product suggestions that improved cross-sell opportunity identification by 25%.

ACHIEVEMENTS

- Ranked 1st: IIT Madras HackerRank Competition
- Ranked 3rd: Gitam HackerEarth Competition
- Semifinalist: Tally Code Brewers Hackathon — among 200+ teams

TECHNICAL SKILLS

ML & AI: ARIMA, Prophet, Scikit-learn, TF-IDF, NLP, LangChain, RAG, Vector Embeddings, PyTorch, TensorFlow, Hugging Face, Pinecone

BI & Analytics: Power BI, Power Query, Power Automate, Excel, ETL Pipelines, Data Modeling, Semantic Models, KPI Development, Plotly

Cloud & DevOps: AWS, GCP, Azure, Azure Blob Storage, Docker, Kubernetes, CI/CD, Terraform
Databases: MySQL, SQL Server, SQLite, PostgreSQL, MongoDB, Snowflake
Frameworks & APIs: Flask, REST APIs, FastAPI, Streamlit, Dash, Next.js
Languages: Python, SQL, DAX, M (Power Query), VBA, R, Java, JavaScript, C++
Tools: Git, GitHub, SharePoint, Windows Task Scheduler, Selenium, PyTest

CERTIFICATIONS

- AWS Certified Cloud Practitioner — Amazon Web Services (AWS) — Feb 2025
- Florida Certified Contract Manager (FCCM) — Florida Department of Management Services — Dec 2025

EDUCATION

Master of Science in Data Science <i>Florida State University, Tallahassee, FL</i>	May 2025 · GPA: 3.93
Bachelor of Technology in Computer Science <i>Gitam University, Visakhapatnam, India</i>	May 2023 · GPA: 8.36
